

User Guide – MODBUS TCP/IP protocol Firmware Version : 8000

DAT 8130

PRELIMINARY DESCRIPTION

All of the data shared by a device communicating by Modbus TCP/IP protocol are mapped in tables, at each data is associated a proper address. Each data can be of two types:

- "REGISTER", data of 2 bytes size (word of 16 bits) that can be associated to analogue input or output, variables, set-point, etc...

- "COIL", data of 1 single bit that can be associated to digital input or output or to a logic state.

A register could contain the image (mirror) of more coils; in example the 16 digital inputs of a device could be read or written as bit (singularly) addressing the coil related to each input or can be read or written as a single word addressing the associated register wherein each bit corresponds to a coil.

In the Modbus protocol, registers and coils are divided as per the following groups of addresses:

0xxxx and 1xxxx = Coils (bit)

3xxxx and 4xxxx = Registers (word)

When reading functions are performed, use the tables indicated below to address the registers .

It is possible to access to the internal registers of the device by direct command Modbus TCP/IP or by the integrated web server.

REGISTERS TABLE

Register Position (*)	Description	Access
40002	Firmware [0]	RO
40003	Firmware [1]	RO
40004	Name [0]	R/W
40005	Name [1]	R/W
40007	Node ID	R/W
40011	System Flags	R/W
40012	Power Up / Safe	R/W
40013	Watchdog timer	R/W
40031	Digital Outputs	R/W
40032	Digital Inputs	RO
40033	Digital Inputs Rise Latch	R/W
40034	Digital Inputs Fall Latch	R/W
40035	Freq. Digital Input 0	RO
40036	Freq. Digital Input 1	RO
40037	Freq. Digital Input 2	RO
40038	Freq. Digital Input 3	RO
40039	32 bit Counter Digital Input 0	R/W
40041	32 bit Counter Digital Input 1	R/W
40043	32 bit Counter Digital Input 2	R/W
40045	32 bit Counter Digital Input 3	R/W

SUPPORTED MODBUS FUNCTION CODES

Function	Description
01	Read Coil Status (0xxxx)
02	Read Inputs Status (1xxxx)

COILS TABLE

NOTES:

(*) If the software DEV9K is in use subtract 1 to the address position number of the register and/or coil.

Registers and coils marked as RO in the column 'Access' are Read Only registers.

Registers and coils marked as R/W in the column 'Access' are Read and Write registers.

For the devices of DAT8000 series, the group of data 0xxxx is the mirror of the group 1xxxx, the group of data 3xxxx is the mirror of the group 4xxxx, therefore the first register could be addressed either as 30002 (with function 04) or 40002 (with function 03).

0x021F

R/W

DESCRIPTION MODBUS REGISTERS

40002 / 40003 : FIRMWARE

Field of 2 read only registers ; contains the firmware identifier provided by the manufactured.

- Default value: 8000 (hex)

40004 / 40005 : NAME

Field of 2 read/write registers (4 bytes or 4 ASCII characters) available for the user, it can contain the name of the device or an abbreviation that identifies its function inside the plant. Each one of the 4 byte could be written by values from 0 to 255, ASCII characters included. The default value of this field contains the identifier of the device expressed in ASCII characters. - Default value: "8130" (ASCII).

40007 : NODE ID

Contains the MODBUS address of the device; the values allowed are from 1 to 255 decimal.

This data is necessary for the correct addressing of the device into the Modbus net and must follow the IP address.

- Default value: Dec: 1, Hex: 01 INIT: Dec 245, Hex : F5.

40011 : SYSTEM FLAGS

Contains the enable bits and system events of the device. The following parameters are configurable:

Watchdog Event Enable: this bit allows to enable the Watchdog Event (0 = Watchdog disabled, 1 = Watchdog enabled). If this bit is active and the device doesn't receive commands for the time specified in the register 40012 "Watchdog time" the outputs of the device will be forced in function of the settings of the register 40011 section "Safe". The Watchdog condition is signalled by the blinking of the led PWR. If this function is required must be implemented at the power-on of the device; the bit must be reset manually when the Watchdog event is occurred. Watchdog Event: if this bit is set as 1 indicates that the Watchdog condition has happened (0 = Normal condition; 1 = alarm condition)

PowerUp Event: this bit is forced to 1 at each power on and indicates that the device has been switched off or reset. With the setting of this bit as 0 and checking its state, it is possible to know if a reset of the device has occurred (0 = reset not occurred; 1 = reset occurred).

Bit	15	14	13	12	11	10	09	08	07	06	05	04	03	02	01	00
Output	-	-	-	-	-	163	162	161	-	-	-	-	-	-	-	-
Value									. Wa	_ Wa	og Ev tchdo wer-up	g Eve	nt	g		

40012 : POWERUP/SAFE

At the power-on (PowerUp) and in case of watchdog alarm (Safe), the output are automatically forced to the value set in this register. Each bit of the register corresponds to a digital output, in function of the following table: - Default value: 0

Bit	15	14	13	12	11	10	09	08	07	06	05	04	03	02	01	00
Output	-	-	-	-	#3	#2	#1	#0	-	-	-	-	#3	#2	#1	#0
Value		Power Up											Safe			

40013 : WATCHDOG TIMER

Contains the value of the WatchDog timer, expressed in step of 1 second. If the WatchDog is enabled and the device doesn't receive commands in a time lower or equal to the value of the one expressed in this register the WatchDog will be activated (see description register "System Flags"). - Default value: 10 (10 sec.)

40031 : DIGITAL OUTPUTS

This register allows to command directly the state of the output relays (0 = OFF ; 1 = ON).

It is also possible to read and drive the outputs using the specific functions of reading and force coils (01-02-05-15) referring to the section in the coils table of which this register is a mirror; it is possible to read and write at the same time all of the bits of this register without implementing the coils' specific functions.

Bit	15	14	13	12	11	10	09	08	07	06	05	04	03	02	01	00
Output	-	-	-	-	-	-	-	-	-	-	-	-	#3	#2	#1	#0

40032 : DIGITAL INPUTS

This register shows the condition of the digital inputs (0 = OFF; 1 = ON).

The same inputs can also be read using the specific functions of reading coils (01-02) referring to the section in the coils table of which this register is a mirror; it is possible to read at the same time all of the bits of this register without implementing the coils' specific functions.

Bit	15	14	13	12	11	10	09	08	07	06	05	04	03	02	01	00
Input	-	-	-	-	-	-	-	-	#7	#6	#5	#4	#3	#2	#1	#0

40033 : DIGITAL INPUTS RISE LATCH

The bits of this register are used to indicate the happened condition of the raise edge (event of change of level from the state 0 to the state 1) of each digital input. The latch event shows the single change of state and is not updated by the system; in the case of it is necessary to monitor this parameter continuously, the single bit or the group of bits must be wrote to 0 after the rising edge happened.

It is also possible to read and drive the bits using the specific functions of reading and force coils (01-02-05-15) referring to the section in the coils table of which this register is a mirror; it is possible to read and write at the same time all of the bits of this register without implementing the coils' specific functions.

Bit	15	14	13	12	11	10	09	08	07	06	05	04	03	02	01	00
Latch	-	-	-	-	-	-	-	-	#7	#6	#5	#4	#3	#2	#1	#0

40034 : DIGITAL INPUTS FALL LATCH

The bits of this register are used to indicate the happened condition of the fall edge (event of change of level from the state 1 to the state 0) of each digital input. The latch event shows the single change of state and is not updated by the system; in the case of it is necessary to monitor this parameter continuously, the single bit or the group of bits must be wrote to 0 after the falling edge happened.

It is also possible to read and drive the bits using the specific functions of reading and force coils (01-02-05-15) referring to the section in the coils table of which this register is a mirror; it is possible to read and write at the same time all of the bits of this register without implementing the coils' specific functions.

Bit	15	14	13	12	11	10	09	08	07	06	05	04	03	02	01	00
Latch	-	-	-	-	-	-	-	-	#7	#6	#5	#4	#3	#2	#1	#0

40035 : FREQUENCY DIGITAL INPUT 0

This register shows the measure of frequency related to the digital input channel 0. The value, expressed in hundredths of Hertz is an Integer 16 bit format. The maximum value of frequency measurable is 300.00 Hz.

40036 : FREQUENCY DIGITAL INPUT 1

This register shows the measure of frequency related to the digital input channel 1. The value, expressed in hundredths of Hertz is an Integer 16 bit format. The maximum value of frequency measurable is 300.00 Hz.

40037 : FREQUENCY DIGITAL INPUT 2

This register shows the measure of frequency related to the digital input channel 2. The value, expressed in hundredths of Hertz is an Integer 16 bit format. The maximum value of frequency measurable is 300.00 Hz.

40038 : FREQUENCY DIGITAL INPUT 3

This register shows the measure of frequency related to the digital input channel 3. The value, expressed in hundredths of Hertz is an Integer 16 bit format. The maximum value of frequency measurable is 300.00 Hz.

40039-40 (LO-HI) : 32 BIT COUNTER DIGITAL INPUT 0

This couple of registers shows the measure of the digital counter related to the input channel 0. The value is incremented at each change of level from 0 to 1 of the input channel; The type of register is a Unsigned Integer 32 bit and uses 2 registers. It is possible to reset the value by direct writing. At each power-on of the device the value is set to 0.

40041-42 (LO-HI) : 32 BIT COUNTER DIGITAL INPUT 1

This couple of registers shows the measure of the digital counter related to the input channel 1. The value is incremented at each change of level from 0 to 1 of the input channel; The type of register is a Unsigned Integer 32 bit and uses 2 registers. It is possible to reset the value by direct writing. At each power-on of the device the value is set to 0.

40043-44 (LO-HI) : 32 BIT COUNTER DIGITAL INPUT 2

This couple of registers shows the measure of the digital counter related to the input channel 2. The value is incremented at each change of level from 0 to 1 of the input channel; The type of register is a Unsigned Integer 32 bit and uses 2 registers . It is possible to reset the value by direct writing. At each power-on of the device the value is set to 0.

40045-46 (LO-HI) : 32 BIT COUNTER DIGITAL INPUT 3

This couple of registers shows the measure of the digital counter related to the input channel 3. The value is incremented at each change of level from 0 to 1 of the input channel; The type of register is a Unsigned Integer 32 bit and uses 2 registers. It is possible to reset the value by direct writing. At each power-on of the device the value is set to 0.

WEB SERVER STRUCTURE

To access the server, run the Web browser and edit in the Address Bar Th IP address of the device.

It will appear the following window. Depending on the Web browser used some icons and/or writings may have little variation of shape and colour. If necessary, it is possible to connect to the Datexel web site to download the data-sheet and the user guide of the device in use clicking on the button "www.datexel.it" in the bottom part of the window.

ILDING AUTOMATION					
	Enter U	sername and Pass	sword then pres	s LOGIN	
		Username)		
		Password			
		LO	GIN		

Write Username and Password. If the default settings are in use the parameters to access are: Username: Fact_user; Password: Fact_pwd Click on the button Login to access to the Home page of the device; it will appear as follows.

HCS								
BUILDING AUTOMATION								
Back	Home	DAT8130	Logout					
		Main Menu						
	•	Network settings						
		System Configuration Software Update						
	C	sername and Password						
		Digital Output						
Visit our website: www.hcs-ba.nl								

By this page it is possible to access the internal parameters of configuration of the device. If the mouse pointer is moved on the button related to a specific menu, it will appear a green tool tip that will help the user with the selection of menus that are the following:

Network Settings: allows to set the Ethernet communication parameters.

System Configuration: allows to set the system configuration parameters. Software Update: allows to execute, if necessary a software update.

Username and Password: allows to set the access data used in the Login page. Digital Input: allows to visualize the parameters related to the digital inputs.

Digital Output: allows to visualize the parameters related to the digital outputs and if necessary to modify them.

In the next sections there is the description of the menus.

	Visit our website:	www.hcs-ba.nl	

Name: allows to visualize and set the parameter NetBios Name of the device; this parameter is a string and is visualized beside the IP address in the software Dev9k; it can also be used in the software that implement the use of this data.

Modbus Address: allows to visualize the modbus address of the device; this parameter is forced to 245 in INIT condition.

Watchdog Enable (ref. Reg "System Flags"): this flag allows to enable the Watchdog event (0 = WatchDog disabled, 1 = WatchDog enabled).

Timeout (ref. Reg "WatchDog timer"): allows to set the value, expressed as step of 1 second, of the WatchDog timer

Watchdog Event (ref. Reg "System Flags"):this flag is used to signal that the Watchdog condition is happened (0 = Normal condition;1 = Alarm condition)

Powerup Event (ref. Reg "System Flags"):this flag is forced to 1 at each power-on and indicates that the device has been switched-off or a reset has occurred. (0 = reset not happened; 1 =reset happened). To save the modified parameters, click the button "Save". To read the parameters from the device click the button "Refresh".

This section allows to visualize the state of the digital inputs and the latchs. Each row is related to each input. To execute a single reading click the button "Read", To execute a continuous reading click the button "Continuos Reading". To stop the reading click the button "Stop". The columns are divided as follows.

Input State (ref. Reg "Digital Inputs") : allows to visualize the state of digital inputs. The indicator light become red when the digital input's state is 1. Rise Latch (ref. Reg "Digital Inputs Rise Latch"): signals the passage of digital input from 0 to 1 (rising edge)

Fall Latch (ref. Reg "Digital Inputs Fall Latch"): signals the passage of digital input from 1 to 0 (falling edge).

The reporting is made for a single passage of state. To reset all latch press the button "Clear Latch".

Counter (ref. Registers "32 bit Counter Digital Input"): displays the value in the counter register associated to the digital input. **Frequency** (ref. Registers "Frequency Digital Input"): displays the value in the counter register associated to the digital input.

This section allows to visualize and drive the digital outputs. Each row is referred to one output. To execute the update of the page click "Refresh". The columns are divided as follow.

Output State (ref. Reg "Digital outputs") : allows to visualize and drive the digital output. The circle will become green with indication "ON" when the digital output will be set as logic state 1; grey with indication "OFF" when the digital output will be set as logic state 0.

PowerUp (ref. Reg "PowerUp/Safe high part"): allows to visualize and set the output logic state for the PowerUp event (ref. Reg "System Flags).

WatchDog (ref. Reg "PowerUp/Safe low part"): allows to visualize and set the output logic state for the Watchdog event (ref. Reg "System Flags).

PROCEDURES

USE OF THE FUNCTION "INIT" (*)

All of the devices of DAT8000 series are equipped with the INIT modality. This is a procedure to access the device by the default parameters and to proceed with its configuration:

IP Address: XXX.XXX.XXX.XXX (assigned by DHCP if enabled)

192.168.1.174 (DHCP disabled, verify that the IP is not in use)

Modbus address: 245

в

By these parameters it is possible to access the device in INIT modality to set and check how it is configured.

To work in INIT follow the procedure:

- Switch-off the device;

- Connect the terminal INIT to terminal -V as shown in the technical datasheet of the device.

- Power-on the device;

- Connect to the device by use of the default above parameters.

When the user finish to work in INIT:

- Switch-off the device;

- Disconnect INIT;

- Power-on the device and connect to it by the known parameters or by those set in INIT modality.

(*): If the software Dev9k is in use, with the goal to allow the correct identification of the device the parameter Netbios name must be set as "DAT8130". If different after the to have searched for the device (Pict 1 in next page), access by the menu Settings->Controller as shown in the picture below.

- IP address assigned by DHCP visualised in the menu Search.

WATCHDOG

The devices of the DAT8000 series are equipped with the Watchdog timer; if enabled it actives an alarm each time that there is not communication between the device and the master. In alarm condition the values of the outputs are automatically set as defined in the register "PowerUp/Safe" that is the condition to which the outputs must be set to avoid damage to the system in case of danger. The value set could not be the same of the value of the outputs before the reset so the user, after the reset has to resend the command to set the output port.

During this alarm condition the green led PWR on the front of the device blinks and the coil "Watchdog Event" is forced to 1". To exit from the alarm condition reset the coil "Watchdog Event": the led stops to blink and will be possible to command the outputs.

FUNCTION BUTTON "P"

In the case it is necessary to restore the default parameters of the device , with device powered and not in INIT condition, push the button "P" located on the front for at least 5 seconds.

The green led PWR will switch-off, the yellow led STS will become orange and the reset of the device will occur. When the reset procedure is finish, both the leds will set back to the default condition and will be loaded the following parameters:

Username: Fact user

Password: Fact pwd

Ethernet:

- IP Address : 192.168.1.100

- Subnet Mask : 255.255.255.0

- Gateway Mask: 192.168.1.1

Modbus:

Address : 1

SEARCH A DEVICE OVER THE NETWORK

•The devices of DAT8000 series are provided with default IP address: 192.168.1.100, modbus address 1.

The PC could work with multiple subnets.

In order to connect with the device, the PC and the device must be in the same network.

It is possible to visualize the PC's IP address running the software Dev9K clicking the button "Get Local IP" under the menu Tools / Search (Pict 1) Pict. 1

Search Port Timeout TCP/IP 1000 mSec DAT9000 DAT3580-MBTCP	Search Stop Search Complete Ethernet ⊕ DAT8130 [192.168.1.115] ⊕ NEWDEV1 [192.168.1.110] ⊕ DS000 [192.168.1.122] ⊕ DAT9> ⊕ DAT9> [192.168.1.129]	Get Local IP 192.168.1.132 Search Mask 255.255.255 List of networks 192.168.1.132 192.168.234.1 Network bind 192.168.1.132 Binding

Make sure the IP identified is used in the Network which the device is connected to.

Click the button "Search"; in the field "List of networks" the available networks for the PC in use will be shown. The IP addresses visualized are those assigned to the PC from each network.

Click, if present, the interested network (192.168.1.xxx) to select the network to use.

Click the button "Binding" to set the network over to search the device. Note: the assignment is executed only for the Dev9k that is running. If the PC is in a subnet different from the one of default of the device, the user has to change the IP of the PC to make possible the change of the device's IP. To do this, open the "Network and Sharing center " of the operating system, go to the Properties of Internet Protocol version 4 of PC (Pict 2) and configure the network parameters in according to the default IP of device : (refer to the section "examples to check Windows configurations")

IP Address : 192.168.1.XXX; modbus address (xx) Subnet Mask: 255.255.255.0 Default Gateway: 192.168.1.1

Pict. 2

	automatically if your network supports eed to ask your network administrator natically
Use the following IP address	s:
IP address:	192 . 168 . 1 . 10
Subnet mask:	255 . 255 . 255 . 0
Default gateway:	192 . 168 . 1 . 1
Obtain DNS server address	automatically
Use the following DNS serve	er addresses:
Preferred DNS server:	211.162.78.1
Alternate DNS server:	211 . 162 . 78 . 2
	Advanced

Now the device of DAT8000 series is searchable and the user can change its IP with the desired one. It must be different from the other ones in the network (right click \rightarrow Set IP address).

Once the device's IP address has been modified, the device will not appear in the results of Dev9k. So the user has to modify the network parameters of PC again in order to display the device.

ADDITIONAL COMMANDS TO DETERMINE THE NETWORK IN USE

It is possible to use the following additional commands to determine to which network is connected the PC. To use it run the command Prompt (cmd.exe) as Administrator in the Windows in use .

To use it run the comman Command "Ipconfig"

It is possible to visualize the nets used by the PC writing this command and press enter.

The system will return a list of all the nets used by the PC. Before to try to establish a communication with the device the user must be sure to be in the correct subnet.

Command "ping"

To determine if a device is connected on the net it is possible to write the command "ping" followed by the IP address of the device and press enter. Example:

ping 192.168.1.100

If the device is connected the system will return the answer from the device with the IP mentioned.

If the systems returns the message Host Unreachable the device is not connected in the net in use.

In this case it is suggested to check the network assigment.

EXAMPLE TO CHECK WINDOWS ® CONFIGURATION

How to change the IP address of the PC (each version of the operative system could change in part from others)
